

CTC Workflow: Reviewing & Reporting Exams

Abraham H. Dachman
The University of Chicago

Aims

- Explain the workflow for CTC interpretation and reporting
 - Environment for Interpretation
 - Quality assurance
 - Common interpretation strategies
 - Generating a CTC report

Workflow of CTC Interpretation

- Confirm segmentation and map out colon
 - 3D transparency view or coronals
- Quality assurance
 - Distention, stool, fluid, tagging
- Search for polyps using both 3D *and* 2D
- Characterize and measure polyp candidates
- Secondary CAD-assisted evaluation
- Search for extracolonic findings
- Report (follow C-RADS guidelines)

**QA Segmentation & Colon Layout
(Supine-Prone Registration)**

```
graph TD; A[Technologist QA] --> B[High Volume CTC Paradigm: Start Read @ CTC Workstation]; A --> C[Low Volume CTC Paradigm: Start Read @PACS]; B --> D[QA Segmentation & Colon Layout (Supine-Prone Registration)]; C --> D;
```

SUPINE

PRONE

The image shows a software interface for colon registration, split into two panels: 'Supine' on the left and 'Prone' on the right. Each panel displays a 3D model of the colon with green and red lines representing different segments. The 'Supine' panel includes a 'Back' button and instructions to right-click the next segment closest to the rectum. The 'Prone' panel includes an 'Update' button and instructions to press 'Update' to change the prone model. At the bottom, there are buttons for 'Registration >>' and 'Finish', along with a prompt to press 'Finish' to complete verification.

Supine

Prone

Right click the next segment closest to rectum.

Press 'Update' to change Prone model.

Press 'Finish' to complete verification.

Registration >> Finish

QA Segmentation & Colon Layout

QA Distention, Stool, Fluid & Tagging

1.5 cm from anal verge-Supine

3D View: Rapid QA of

- Location of segments
 - tortuosity
 - mobility when comparing supine to prone
- Identify ileocecal valve
- Quality of distention

2D QA CHECKLIST

- Retained stool
 - size and tagging
- Retained fluid
 - quantity
 - location
 - tagging
 - change supine – prone
- Artifacts (e.g., metal, breathing)

QA by technologist includes review of axial images for **distention**: most *critical* for diagnostic quality

You **MUST** identify the IC valve, but this is **NOT** always intuitive . . .

- Identify by:
 - Location
 - Fat
 - Shape
 - Papillary (dome-shaped)
 - Labial
 - Mixed

Poor Preparation

Excessive untagged feces

Quality Assurance: The Bottom Line

- Are any segments obscured on both views?
- Could a 10 mm polyp be hidden?

SAM Question:

Intentionally Hidden for Handout

Response 1.

Response 2.

Response 3.

Response 4.

QA Segmentation & Colon Layout

QA Distention, Stool, Fluid & Tagging

3D Primary Read: Polyp search, measure, find flat lesions

Methods of Interpretation

- 3D with 2D problem solving
- 2D with 3D problem solving
- Soft tissue windows for flat lesions
- Bone windows for dense oral contrast tagged fluid and stool
- Virtual Pathology (open views)
- Computer-aided diagnosis (CAD)

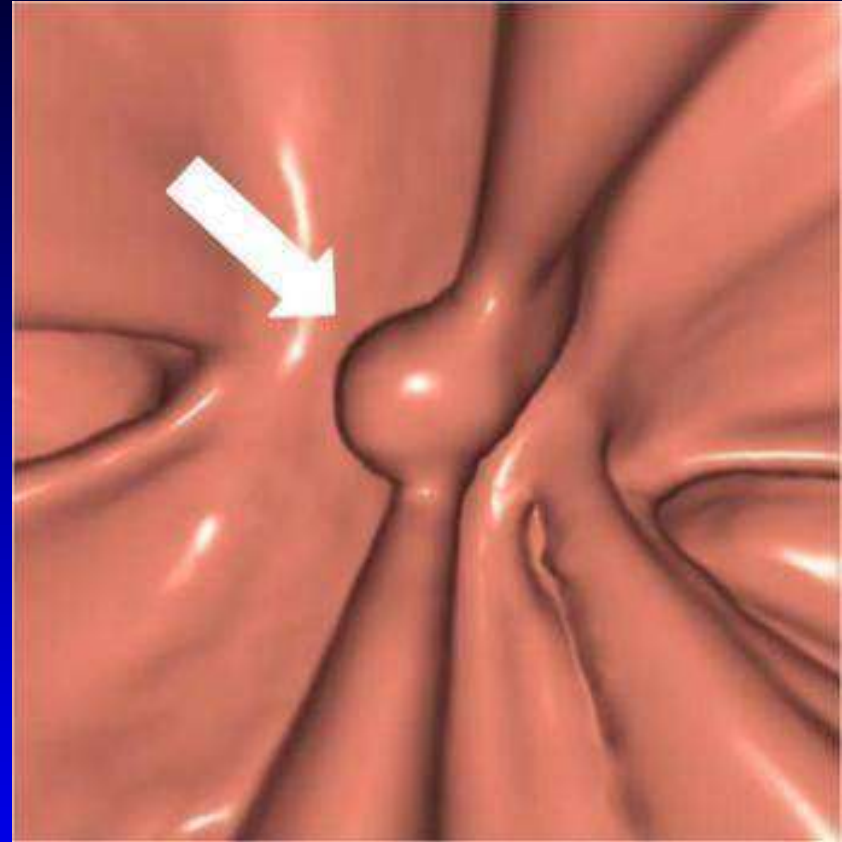

Methods of Interpretation

- 3D with 2D problem solving
- 2D with 3D problem solving
- Soft tissue windows for flat lesions
- Bone windows for dense oral contrast tagged fluid and stool
- Virtual Pathology (open views)
- Computer-aided diagnosis (CAD)

Basic Feature of Polyps

**6 mm Polyp on a Fold
Coated with tagging agent**

prone

supine

Non-tagged Stool Mobile, With Internal Gas

SUPINE

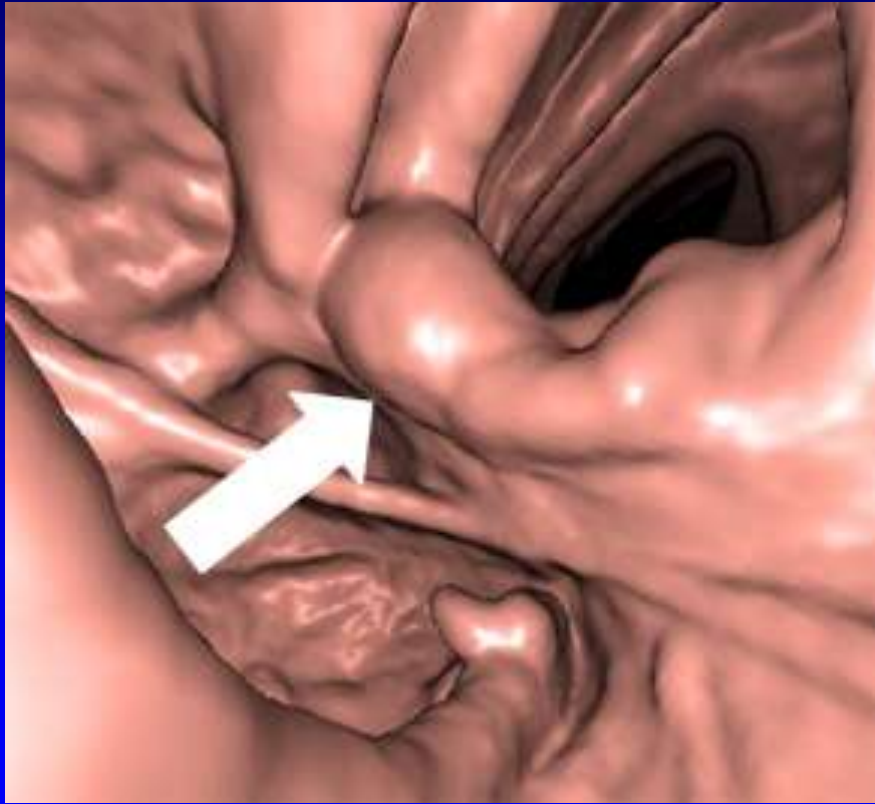

PRONE

Well – Tagged Stool

Lipoma on the ICSV

Dedicated Read for Flat Lesions

Wide Soft Tissue Window in 2D

Endoscopic view

Approach to Polyp Candidate Analysis

- Polyp vs. fold > use > 3D or MPRs
- Polyp vs. stool > use > texture (W/L or color map)
 - If solid
 - Compare supine / prone for mobility
 - If mobile, check for long stalk, colonic rotation / flip

Primary 3D Read Strategies

- Forward and backward
- Supine and prone
- Special software features (e.g., color map for polyp characterization, show blind areas)
- Problem solve in 2D as needed as you read
- Bookmark & defer difficult problem solving (e.g., difficult supine/prone comparison)

Primary 2D Read

Learn to “Track the Colon”

- Highly magnified axial
- Go slowly ! Look at all surfaces
- Evaluate very short segments as you move along an imaginary centerline
- Use a lung window (1500/-600) setting or “colon” (2000/0)
- Non-magnified or magnified MPR
- Simultaneous or deferred endoluminal comparison

90

120

Retrograde

3D Over-measurement Pitfall

“falling off the cliff”

- Use largest dimension on either 2D or 3D to triage management
- Per “C-RADS” 6 mm threshold for reporting polyps

Flat Lesions: Use Wide Soft Tissue Window

Generate Report

Structured CTC Reporting

- History
- Prep
- Informed of exam limitations
- Technique
- Colon findings
- Extracolonic findings
- C-RADS scores / Recommendations
- Footnote qualifier / reference C-RADS

C-RADS Classification

- C0 Inadequate study (can not evaluate 10 mm lesions)
- C1 Normal, routine follow up (Q 5 yrs CTC)
- C2 Indeterminate; 1-3 yr f/u
 - Polyp 6-9 mm, ≤ 3 in number
 - Findings indeterminate; cannot exclude polyps ≥ 6 mm
- C3 10 mm or ≥ 3 6-9mm polyps \rightarrow Colonoscopy
- C4 Mass, likely malignant; surgical consult

**Zalis et al for the Working Group on VC. Radiology 2005;236:3-9.*

Sample Histories

History: 55 year old male. CTC for colorectal cancer screening.

History: 55 year old male. Anemia. Diagnostic CTC for colorectal cancer screening.

History: 55 year old male. History of incomplete colonoscopy in 2008. Asymptomatic. CTC for colorectal cancer screening.

Sample Report

Findings 1st Paragraph

Sample #1:The colon was well distended and cleansed. A small amount of residual fluid in the right colon and rectosigmoid was well-tagged with oral contrast.

Sample #2:The colon was well distended and cleansed except for particulate stool in right colon limiting sensitivity for small polyps. A moderate amount of residual fluid in the right colon and rectosigmoid was weakly tagged with oral contrast.

Summary

- **Both 2D and 3D skills are needed – use it in every case**
- **Use a systematic approach that involves QA of images, recognition of anatomic landmarks and supine-prone comparison**
- **Recognize pitfalls and use CAD secondary read**
- **Report using C-RADS guidelines and recommendations**
